Intentions

01_Introduction.tex → Why is it important to have a model detecting infant affect? What is my paper about?

02_Related Work.tex → How did others achieve such task and what did they found?

03_Methods.tex → What tools and datasets am I using? (description of datasets and SmoothGrad, probably should include what a Vision Transformer is, not sure?)

04_Experiments.tex → All the experiments I have done : why did I choose to work with the the colour images, why did I choose that to work with that model from the Hugging face, how did I fine-tuned it, and how did I implemented Smoothgrad

05_Results.tex → The results of the model (where did it fail and its accuracy); the interpretation of SmootGrad heatmaps per each class

06_Discussion.tex → Why did the model misclassified the negative images with neutral and the limitations of the project

07_Conclusion.tex → Summarizes the whole process and the results, pretty much the whole paper, without details

09_Appendix.tex →links for all the other models, normalized pixel distribution, all the images when SmoothGrad was applied

10_References.tex → list of other papers I used to describe stuff
